

What is Ammonia?

Ammonia is a simple compound consisting of three hydrogen atoms bonded to a single nitrogen atom and has the chemical formula NH_3 . It has a boiling point of $-33.34\text{ }^\circ\text{C}$ ($-28.012\text{ }^\circ\text{F}$) at atmospheric pressure and is normally stored as a liquefied gas. Because of its chemical structure, it contains more hydrogen per unit volume than liquefied hydrogen. The hydrogen is tightly bound to the nitrogen, which makes it a very stable and difficult to ignite chemical.
